

SV3.network

sv3.network — Web3-Native Document & Compliance Platform

One-Line Pitch

sv3.network is the Web3-native version of SignVault.io — turning documents into on-chain Real-World Assets (RWAs) with verifiable e-signatures, organizations, and compliance workflows on any EVM chain.

Project Description

sv3.network is a decentralized document and compliance network built on top of EVM-compatible blockchains. It reimagines how enterprises handle critical documents by bringing the entire workflow, from creation to signatures to organizational access control, on-chain.

- **On-chain Identity:** Users sign in with their wallets (no passwords, no emails).
 - **Tokenized Documents (RWAs):** Every uploaded document becomes an NFT (ERC-721/1155), linking real-world assets with cryptographic proof.
 - **Verifiable Signatures:** Signatures are on-chain events tied to wallet addresses, providing permanent and tamper-proof proof of consent.
 - **Organizations & Teams On-Chain:** Companies, teams, and members are represented as smart contracts, with transparent access policies.
 - **Compliance-Ready by Design:** Every action - creation, signing, modification, is logged immutably on the blockchain.
-

Problem We're Solving

- Web2 document management systems are **centralized, trust-based, and opaque**.
 - Enterprises spend huge resources on **compliance audits, legal verification, and document security**.
 - Current e-signature platforms (e.g., DocuSign) cannot provide **provable, decentralized, immutable guarantees**.
-

Our Solution

sv3.network makes every document and organizational record **verifiable on-chain**, drastically reducing compliance costs, improving security, and enabling borderless collaboration.

Think **SignVault.io meets Ethereum**, but instead of a closed SaaS, it's **open, composable, and blockchain-native**.

Core Features

1. **Wallet-based Onboarding** → Seamless sign-up with Metamask, Coinbase Wallet, or WalletConnect.
 2. **Documents as RWAs** → Documents are minted as NFTs with metadata + IPFS storage.
 3. **On-Chain Signatures** → Sign with your wallet; signature event stored on-chain.
 4. **Organizations & Teams** → Register orgs/teams with wallet-based memberships.
 5. **Audit Trail** → Immutable blockchain ledger for compliance & legal audits.
-

Why Now?

- Enterprises are already exploring **RWAs and tokenized assets**.
 - LegalTech + Web3 = untapped \$50B+ market.
 - Growing adoption of **Base, Avalanche, and Ethereum L2s** makes on-chain document flows practical and cost-efficient.
-

Future Vision

- **Cross-chain interoperability** (Base, Avax, Monad).
 - **ZK Proofs** for private documents.
 - **Integration with enterprise ERPs and compliance systems**.
 - **DeFi x Compliance**: Use signed docs as collateral for financing.
-

Business Model

- **Transaction fees** on document minting/signing.
 - **Enterprise subscriptions** for org/team management.
 - **Compliance APIs** for audits & regulators.
-

Hackathon Demo Flow

1. User connects wallet.
 2. Creates or joins an organization.
 3. Uploads a document → minted as NFT (RWA).
 4. Signs document → on-chain proof of signature.
 5. Dashboard shows org members, documents, and signatures.
-

Taglines / Marketing Copy

- "Documents, Signatures, Compliance, On-Chain."
 - "sv3.network: The Web3-native SignVault."
 - "From PDF to NFT: Turning documents into real-world assets."
 - "No passwords. No SaaS lock-in. Just verifiable trust."
-

Pitch Closing Line

sv3.network is building the missing bridge between enterprise compliance and blockchain trust - transforming how the world signs, stores, and secures its most important documents.
